

Ten stylized facts — BTC, calibrated closed-loop roll-outs vs real order flow (mean $\pm$ 95% CI over checkpoints; band = real)

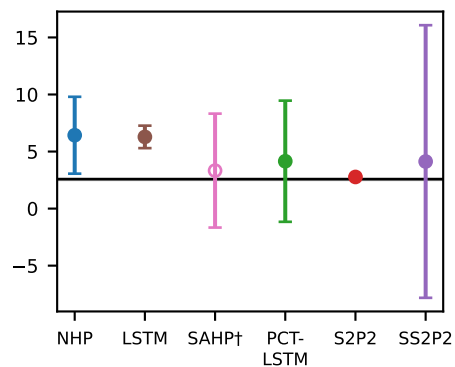

F1 |ACF r| lags 1-10
(≈ 0 : linear unpredictability)

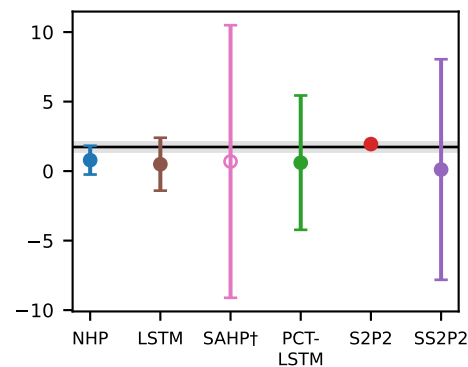

F2a excess kurtosis
(heavy tails, > 0)

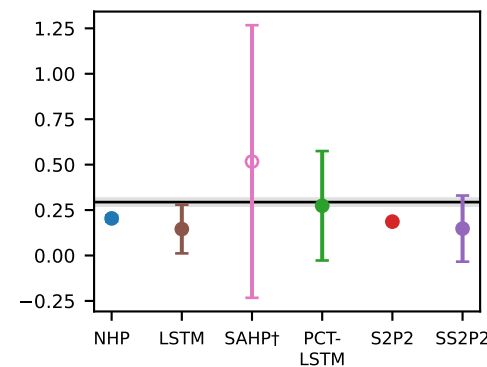

F2b Hill tail index

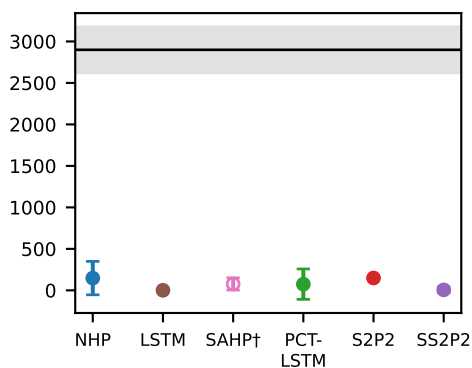

F3 return skewness

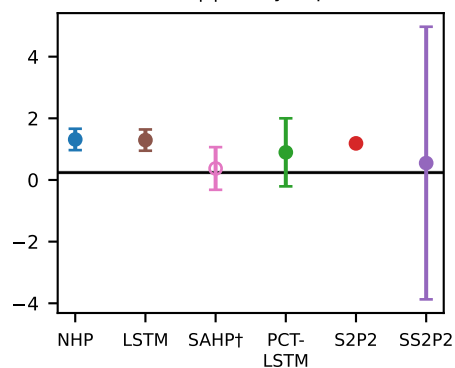

F6 ACF |r| lags 1-10
(volatility clustering, > 0)

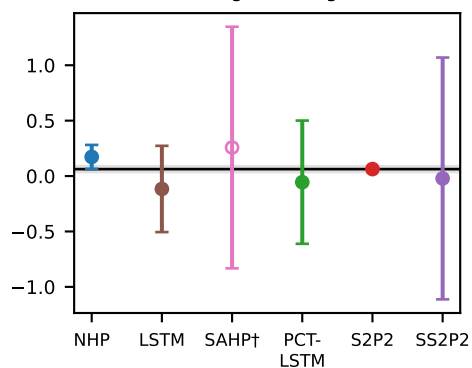

F7 aggregated kurtosis
(rescaled, 10s)

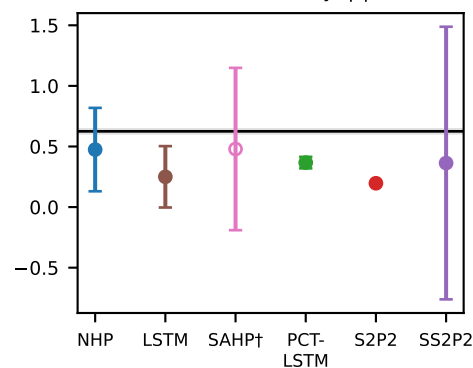

F8 ACF |r| decay exponent

F9 leverage corr lags 1-10

F10 corr(activity, |r|)

F11 timescale asymmetry
(coarse→fine, > 0)
