

LGM: $\lambda_k(t) = \Lambda(t) \cdot p(k | t)$

Linear ground rate $\Lambda(t)$

multi-timescale linear Hawkes

$$\Lambda = \mu_0 + \sum_m a_m s_m(t)$$

rate-pin: $\mu_0 = R(1-n) \Rightarrow \Lambda = R$

branching $n = \sum_m a_m / \beta_m$ (gauge-free)

$$\text{Fano}(\infty) = 1/(1-n)^2$$

Deep soft-max marks $p(k|t)$

$p(\cdot|t) = \text{softmax}(z_{\theta}(t))$

on the 62-type simplex

rate-neutral: $\sum_k p_k = 1$

$\Rightarrow \sum_k \lambda_k = \Lambda$ regardless of
how nonlinear the mark net is

per-type intensity $\lambda_k(t)$

calibrated • certifiable • clustered
